

**Elizabeth Goluch, Morning Glory**  
Discipline: Horticulture

Horticulture is the branch of agriculture that deals with the art, science and technology of plants. Dating as far back as the 1600s, women interested in science and the natural world assumed an innovative and invaluable role in the field, tabulating insects and pests that were attracted to, or attacked particular flora. Equally important, these women often produced beautiful and accurate drawings of the plants and the insects, eggs, larvae and pupae found on or around them.

One such woman who comes to mind is Marion E. Moodie. Although she was trained as a nurse, she was an avid botanist and collected many specimens, which were displayed in prestigious institutions such as the Smithsonian, Harvard, and McGill University.

Another is Margaret Rae, the first woman to earn a Master's degree in entomology at the University of Saskatchewan. She became a forest entomologist for the government, conducting field studies throughout North America, as well as publishing a book, "Injurious Insects of the Farm and Field."
